

# Why does paper have high energy storage

Can power paper store energy?

Researchers at Linköping University's Laboratory of Organic Electronics, Sweden, have developed power paper - a new material with an outstanding ability to store energy. The material consists of nanocellulose and a conductive polymer. The results have been published in Advanced Science.

How much energy can a sheet of paper store?

The results have been published in Advanced Science. One sheet, 15 centimetres in diameter and a few tenths of a millimetre thick can store as much as 1 F, which is similar to the supercapacitors currently on the market. The material can be recharged hundreds of times and each charge only takes a few seconds.

Why does paper use a lot of electricity?

This is because a lot of electricity is required to operate the production facilities- especially to remove the water necessary for paper production from the paper web again. According to current statistics from Statista Research, the paper industry consumed a total of around 1,361 petajoules of energy in 2021 (source: eurostat).

How can thermal energy storage help the paper industry?

Thermal energy storage systems can help the paper industry save costs and emissions in the long term due to their high flexibility, durability and efficiency. As flexible storage solutions, they can make a decisive contribution to advancing the electrification of paper production and recycling processes.

Why is the paper industry so energy-intensive?

In terms of energy demand, the paper industry is one of the most energy-intensive industries. This is because a lot of electricity is required to operate the production facilities- especially to remove the water necessary for paper production from the paper web again.

Does recycled paper save energy?

On the other hand, less energy is needed for the process as a whole. According to the German Federal Environment Agency, the production of recycled paper saves an average of 78 per cent water, 68 per cent energy and 15 per cent CO<sub>2</sub> emissions compared to paper made from so-called primary pulp - usually wood.
