Can energy storage systems reduce wind power ramp occurrences and frequency deviation?

Rapid response times enable ESS systems to quickly inject huge amounts of power into the network, serving as a kind of virtual inertia [74, 75]. The paper presents a control technique, supported by simulation findings, for energy storage systems to reduce wind power ramp occurrences and frequency deviation.

Why should wind energy be stored?

Reduces Dependency on Fossil Fuels: Storage allows for a greater integration of wind energy into the power grid, reducing the need for fossil fuel-based power plants and decreasing greenhouse gas emissions.

The ability to store energy can facilitate the integration of clean energy and renewable energy into power grids and real-world, everyday use. Bronstein in 2011 made a positive correlation between advancement in development of high altitude wind energy (HAWE) systems to the price of oil [4]. Same author stated that present state of development in concepts for capturing high altitude wind power still encounters many technical and policy difficulties.

They become steadier, more persistent and of higher velocity magnitude [5]. This means that development of concepts which aim to harvest winds on these heights may result in new and powerful category of renewable energy sources. These concepts are called high altitude wind energy (HAWE) or high altitude wind power (HAWP) systems.

Such optimization is a means to maximize the financial yield of an offshore wind farm installation with this new CAES + HPT concept. The use of such energy storage system can help alleviate a fundamental shortcoming with wind power generation: when there is wind, there is power generated, causing an excess of power in the power grid which ...
