

What is the capacity of C/TiO₂@Li||LiFePO₄ batteries?

As depicted in Fig. 7 a, C/TiO₂@Li||LiFePO₄ full batteries display a high initial capacity of 128 mAh g⁻¹, high Coulombic efficiency of 99.2% and stable cycle performance over 250 cycles at a current density of 1C (1C = 170 mA g⁻¹).

How efficient is a C/TiO₂ Li battery?

Even the capacity and current density are further elevated to 2 mAh cm⁻² and 2 mA cm⁻² (Fig. 6 b), C/TiO₂||Li battery still maintains highly stable cycle performance and delivers an average Coulombic efficiency as high as 97.7%. Fig. 6 c and d display corresponding charge/discharge curves of Cu||Li and C/TiO₂||Li batteries, respectively.

Does 3D freestanding c/tio₂ host improve cyclic stability of Li metal anodes?

Moreover, the deposited Li film is also very compact without any sharp dendrites, which may be favorable to improve cyclic stability and lifespan of Li metal anodes. The results remarkably indicate that 3D freestanding C/TiO₂ host can effectively alleviate detrimental Li dendrites growth and buffer volume expansion during Li plating (Fig. 5 b).

Supercapacitor is an efficient energy storage device, yet its wider application is still limited by self-discharge. Currently, various composite materials have been reported to have improved inhibition on self-discharge, while the evaluation of the synergistic effect in composite materials is challenging.

Thickening of electrodes is crucial for maximizing the proportion of active components and thus improving the energy density of practical energy storage cells. Nevertheless, trade-offs between electrode thickness and electrochemical performance persist because of the considerably increased ion transport resistance of thick electrodes.
